The G1/S transition is a stage in the cell cycle at the boundary between the G1 phase, in which the cell grows, and the S phase, during which DNA is replicated. It is a cell cycle check point where DNA integrity is assessed and the cell cycle can pause in response to improperly or partially replicated DNA. During this transition the cell makes decisions to become quiescent (enter G0 ...

Introduction. Some prokaryotes and most eukaryotes possess a form of a circadian clock, reflecting the convergent evolution of the ability to align biologic processes with the day-night cycle (Dibner and Schibler, 2015). In mammals, the clock circadian regulator (CLOCK) and brain and muscle ARNT-like 1 (BMAL1) heterodimer drives expression of many E-box containing genes, including those ...

Microglia, the brain's primary immune sentinels, quickly regenerate and restore their population after an acute insult. Lihong Zhan, Li Gan and colleagues use lineage tracing to address the debate about the origin of repopulating microglia and describes the spatial and temporal characteristics of microglial regeneration.

Melatonin may serve as a potential therapeutic free radical scavenger and broad-spectrum antioxidant. It shows neuroprotective properties against hypoxic-ischemic brain injury in animal models. The authors review the studies focusing on the neuroprotective potential of melatonin and its possibility of treatment after perinatal asphyxia.
